1.1 Introduction

The purpose of this assignment is to convert a matlab type language dubbed fcal, into c++ style format, with proper checking for syntactical, semantical, and lexical errors.

1.2 Members

Xukun Qin 5188260 Dalton Stokke 4117123

1.3 Test

To test this program type : make run-tests You can also type : make cpp cpp is a target in the Makefile that will run the linter.

1.4 Structure

This program utilizes multiple classes to function as nodes containing information about various parts of our matlab type language. Specifically the token class in the scanner namespace and all classes that are members of the ast namespace, these include the abstract super classes Node, Program, Stmts, Stmt, Expr, and Decl, as well as all of their subsequent sub-classes. The classes in the ast namespace serve as members of an Abstract Syntax Tree, the ast can be created by calling parse on a .dsl file and this can also be undone by calling unparse to recreate that file. See UML_Iteration3.pdf in project/ directory for more details on ast structure.

1.5 Brief

This Brief is an arch-comment for each concrete class that inherits from the abstract classes Program, Stmts, Stmt, Decl, and Expr: These classes will implement their own definition of the unparse() function, and have their own constructors which will take in different numbers of parameters, namely some assortment of type std::string, Expr*, Decl*, Stmts*, and Stmt*. Some classes are further explained with more comments describing unusual parameters or function. See below.
